How to Set up RabbitMQ Cluster on Ubuntu 18.04 LTS

RabbitMQ is an open source message-broker software that originally implemented the AMQP (Advanced Message Queuing Protocol) protocol, and while it has been developed and extended in order to support other protocols such as STOMP (Streaming Text Oriented Messaging Protocol), and MQTT (Message Queuing Telemetry Transport).

A message-queueing / message-broker software is used for sending and receiving messages between distributed systems, applications, and services. RabbitMQ is written in the Erlang programming language, it offers support for client interfaces and libraries for all major programming languages including Python, NodeJS, Java, PHP etc.

In this tutorial, I will show you how to set up a RabbitMQ Cluster on Ubuntu 18.04 Server. I will install a RabbitMQ Cluster using three Ubuntu servers, enable the RabbitMQ Management, and Setup the HA policy for all nodes.

On this page

- [Prerequisites](#)
- [What we will do?](#)
- [Step 1 - Setup Hosts File](#)
- [Step 2 - Install RabbitMQ Server](#)
- [Step 3 - Enable RabbitMQ Management Plugins](#)
- [Step 4 - Setup UFW Firewall](#)
- [Step 5 - Setup RabbitMQ Cluster](#)
- [Step 6 - Setup New Administrator User](#)
- [Step 7 - RabbitMQ Setup Queue Mirroring](#)
- [Step 8 - Testing](#)
- [Reference](#)

Prerequisites

- 3 or more Ubuntu 18.04 Servers
- 10.0.15.21 hakase-ubuntu01
- 10.0.15.22 hakase-ubuntu02
- 10.0.15.23 hakase-ubuntu03
- Root privileges

What we will do?

- Setup Hosts File
- Install RabbitMQ Server

- Enable Management Plugins
- Setup UFW Firewall
- Setup RabbitMQ Cluster
- Setup New Administrator User
- RabbitMQ Setup Queue Mirroring
- Testing

Step 1 - Setup Hosts File

In this step, we will edit the '/etc/hosts' file on all servers and map each server IP address as a hostname.

Edit the '/etc/hosts' file using [vim](#) editor.

```
sudo vim /etc/hosts
```

Now paste the following configuration there.

```
10.0.15.21 hakase-ubuntu01
10.0.15.22 hakase-ubuntu02
10.0.15.23 hakase-ubuntu03
```

Save and exit.

Step 2 - Install RabbitMQ Server

Before installing RabbitMQ server, make sure all repositories are updated.

Run the following command.

```
sudo apt update
sudo apt upgrade
```

Now install the RabbitMQ server packages from the Ubuntu repository using the apt command below.

```
sudo apt install rabbitmq-server -y
```

And after the installation is complete, start the RabbitMQ service and enable it to launch everytime at system boot.

```
sudo systemctl start rabbitmq-server
sudo systemctl enable rabbitmq-server
```

[Learn more](#)

The RabbitMQ Server has been installed on Ubuntu 18.04.

```
root@hakase-ubuntu01:~#
root@hakase-ubuntu01:~# sudo apt install rabbitmq-server -y
Reading package lists... Done
Building dependency tree
Reading state information... Done
rabbitmq-server is already the newest version (3.6.10-1).
0 upgraded, 0 newly installed, 0 to remove and 141 not upgraded.
root@hakase-ubuntu01:~#
root@hakase-ubuntu01:~# sudo systemctl start rabbitmq-server
root@hakase-ubuntu01:~# sudo systemctl enable rabbitmq-server
Synchronizing state of rabbitmq-server.service with SysV service script with /lib/systemd/systemd-sysv-install.
Executing: /lib/systemd/systemd-sysv-install enable rabbitmq-server
root@hakase-ubuntu01:~#
root@hakase-ubuntu01:~#
```

Step 3 - Enable RabbitMQ Management Plugins

In this step, we will enable RabbitMQ management plugins. It's an interface that allows you to monitor and handle RabbitMQ server from the web browser, running on the default TCP port '15672'.

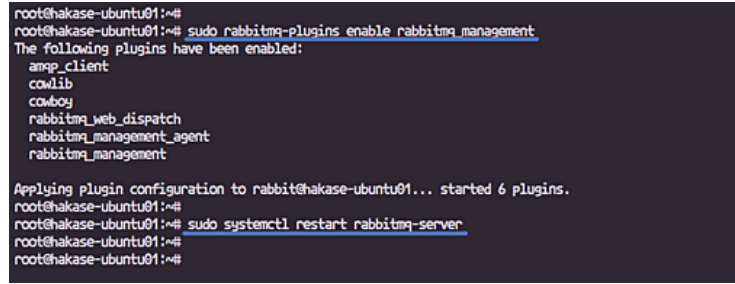

Enable the RabbitMQ management plugins by running the command below.

```
sudo rabbitmq-plugins enable rabbitmq_management
```

Make sure there is no error, then restart the RabbitMQ service.

```
sudo systemctl restart rabbitmq-server
```

RabbitMQ Management plugins have been enabled.

```
root@hakase-ubuntu01:~#  
root@hakase-ubuntu01:~# sudo rabbitmq-plugins enable rabbitmq_management  
The following plugins have been enabled:  
  amqp_client  
  cowlib  
  cowboy  
  rabbitmq_web_dispatch  
  rabbitmq_management_agent  
  rabbitmq_management  
  
Applying plugin configuration to rabbit@hakase-ubuntu01... started 6 plugins.  
root@hakase-ubuntu01:~#  
root@hakase-ubuntu01:~# sudo systemctl restart rabbitmq-server  
root@hakase-ubuntu01:~#  
root@hakase-ubuntu01:~#
```

Step 4 - Setup UFW Firewall

In this tutorial, we will enable the Ubuntu UFW firewall. We need to open some ports that will be used by the RabbitMQ server.

Add the ssh service to the UFW firewall and enable the firewall service.

```
sudo ufw allow ssh  
sudo ufw enable
```

Now add new RabbitMQ tcp ports '5672,15672,4369,25672'.

```
sudo ufw allow 5672,15672,4369,25672/tcp
```

Then check the UFW firewall ports list.

```
sudo ufw status
```

```

root@hakase-ubuntu01:~#
root@hakase-ubuntu01:~# sudo ufw allow ssh
Rules updated
Rules updated (v6)
root@hakase-ubuntu01:~#
root@hakase-ubuntu01:~# sudo ufw enable
Command may disrupt existing ssh connections. Proceed with operation (y/n)? y
Firewall is active and enabled on system startup
root@hakase-ubuntu01:~#
root@hakase-ubuntu01:~# sudo ufw allow 5672,15672,4369,25672/tcp
Rule added
Rule added (v6)
root@hakase-ubuntu01:~# sudo ufw status
Status: active

To Action From
--
22/tcp ALLOW Anywhere
4369,5672,15672,25672/tcp ALLOW Anywhere
22/tcp (v6) ALLOW Anywhere (v6)
4369,5672,15672,25672/tcp (v6) ALLOW Anywhere (v6)

root@hakase-ubuntu01:~#
root@hakase-ubuntu01:~#

```

The Ubuntu UFW firewall configuration has been completed, and we're ready to set up the RabbitMQ Cluster.

Step 5 - Setup RabbitMQ Cluster

In order to setup the RabbitMQ cluster, we need to make sure the '.erlang.cookie' file is same on all nodes. We will copy the '.erlang.cookie' file on the '/var/lib/rabbitmq' directory from 'hakase-ubuntu01' to other node 'hakase-ubuntu02' and 'hakase-ubuntu03'.

Copy the '.erlang.cookie' file using scp commands from the 'hakase-ubuntu01'.

[Learn more](#)

```

scp /var/lib/rabbitmq/.erlang.cookie root@hakase-ubuntu02:/var/lib/rabbitmq/
scp /var/lib/rabbitmq/.erlang.cookie root@hakase-ubuntu03:/var/lib/rabbitmq/

```

Make sure there is no error on both servers.

```

root@hakase-ubuntu01:~#
root@hakase-ubuntu01:~# scp /var/lib/rabbitmq/.erlang.cookie root@hakase-ubuntu02:/var/lib/rabbitmq/
The authenticity of host 'hakase-ubuntu02' (192.168.1.22) can't be established.
(CSSA key fingerprint is 940261:2406d5e9c773:b4c949f5f423490-0UN0V).
Are you sure you want to continue connecting (yes/no)? yes
Warning: Permanently added 'hakase-ubuntu02,192.168.1.22' (ECDSA) to the list of known hosts.
root@hakase-ubuntu01:~#
root@hakase-ubuntu01:~# scp /var/lib/rabbitmq/.erlang.cookie root@hakase-ubuntu03:/var/lib/rabbitmq/
The authenticity of host 'hakase-ubuntu03' (192.168.1.23) can't be established.
(CSSA key fingerprint is 940261:2406d5e9c773:b4c949f5f423490-0UN0V).
Are you sure you want to continue connecting (yes/no)? yes
Warning: Permanently added 'hakase-ubuntu03,192.168.1.23' (ECDSA) to the list of known hosts.
root@hakase-ubuntu01:~#
root@hakase-ubuntu01:~#

```

Next, we need to setup 'hakase-ubuntu02' and 'hakase-ubuntu03' to join the cluster 'hakase-ubuntu01'.

Note:

- Run commands below on hakase-ubuntu02' and 'hakase-ubuntu03' servers.

Restart the RabbitMQ service and stop the app.

```

sudo systemctl restart rabbitmq-server
sudo rabbitmqctl stop_app

```

Now let RabbitMQ server on both nodes join the cluster on 'hakase-ubuntu01', then start the app.

gpdhost.com

[Learn more](#)

```
sudo rabbitmqctl join_cluster rabbit@hakase-ubuntu01
sudo rabbitmqctl start_app
```

When it's complete, check the RabbitMQ cluster status.

```
sudo rabbitmqctl cluster_status
```

And you will get the results as below.

```
root@hakase-ubuntu02:~#
root@hakase-ubuntu02:~# sudo systemctl restart rabbitmq-server
root@hakase-ubuntu02:~#
root@hakase-ubuntu02:~# sudo rabbitmqctl stop_app
Stopping rabbit application on node 'rabbit@hakase-ubuntu02'
root@hakase-ubuntu02:~#
root@hakase-ubuntu02:~# sudo rabbitmqctl join_cluster rabbit@hakase-ubuntu01
Clustering node 'rabbit@hakase-ubuntu02' with 'rabbit@hakase-ubuntu01'
root@hakase-ubuntu02:~#
root@hakase-ubuntu02:~# sudo rabbitmqctl start_app
Starting node 'rabbit@hakase-ubuntu02'
root@hakase-ubuntu02:~#
root@hakase-ubuntu02:~# sudo rabbitmqctl cluster_status
Cluster status of node 'rabbit@hakase-ubuntu02'
[(nodes, [(disc, ['rabbit@hakase-ubuntu01', 'rabbit@hakase-ubuntu02',
'rabbit@hakase-ubuntu03'])]),
 (running_nodes, ['rabbit@hakase-ubuntu03', 'rabbit@hakase-ubuntu01',
'rabbit@hakase-ubuntu02']),
 (cluster_name, <<"rabbit@hakase-ubuntu02">>),
 (partitions, []),
 (alarms, [{('rabbit@hakase-ubuntu03', [])},
{('rabbit@hakase-ubuntu01', [])},
{('rabbit@hakase-ubuntu02', [])}])]
root@hakase-ubuntu02:~#
root@hakase-ubuntu02:~#
```

The RabbitMQ Cluster has been created, with hakase-ubuntu01, hakase-ubuntu02, and hakase-ubuntu03 as members.

Step 6 - Setup New Administrator User

In this tutorial, we will create a new admin user for our RabbitMQ server and delete the default 'guest' user. We will be creating a new user from 'hakase-ubuntu01', and it will be automatically replicated to all nodes on the cluster.

Add a new user named 'hakase' with password 'aqwe123@'.

```
sudo rabbitmqctl add_user hakase aqwe123@
```

Setup the 'hakase' user as an administrator.

```
sudo rabbitmqctl set_user_tags hakase administrator
```

And grant the 'hakase' user permission to modify, write, and read all vhosts.

Why are some **INVESTMENTS** more successful than others?

Ad Fast and reliable conducting of transactions on Shares, I

FIBO Group

[Learn more](#)

```
sudo rabbitmqctl set_permissions -p / hakase ".*" ".*" ".*"
```

Now delete the default 'guest' user.

```
sudo rabbitmqctl delete_user guest
```

And check all available users.

```
sudo rabbitmqctl list_users
```

And you will get the result as below.

```
root@hakase-ubuntu01:~# sudo rabbitmqctl add_user hakase aqwet23@
root@hakase-ubuntu01:~# Creating user "hakase"
root@hakase-ubuntu01:~# sudo rabbitmqctl set_user_tags hakase administrator
root@hakase-ubuntu01:~# Setting tags for user "hakase" to [administrator]
root@hakase-ubuntu01:~# sudo rabbitmqctl set_permissions -p / hakase ".*" ".*" ".*"
root@hakase-ubuntu01:~# Setting permissions for user "hakase" in vhost "/"
root@hakase-ubuntu01:~# sudo rabbitmqctl delete_user guest
root@hakase-ubuntu01:~# Deleting user "guest"
root@hakase-ubuntu01:~# sudo rabbitmqctl list_users
root@hakase-ubuntu01:~# Listing users
hakase [administrator]
root@hakase-ubuntu01:~#
```

A new RabbitMQ administrator user has been created, and the default 'guest' user is deleted.

Step 7 - RabbitMQ Setup Queue Mirroring

By default, contents of a queue within a RabbitMQ cluster are located on a single node (the node on which the queue was declared).

This setup is must, we need to configure the 'ha policy' cluster for queue mirroring and replication to all cluster nodes. If the node that hosts queue master fails, the oldest mirror will be promoted to the new master as long as it synchronized, depends on the 'ha-mode' and 'ha-params' policies.

Below some example about RabbitMQ ha policies.

Setup ha policy named 'ha-all' which all queues on the RabbitMQ cluster will be mirroring to all nodes on the cluster.

```
sudo rabbitmqctl set_policy ha-all ".*" '{"ha-mode":"all"}'
```

Play Rise of Civilizations On Your PC To Make Levelling And Winning Battles Faster

Ad Use Your Bigger Screen, Keyboard, And Mouse To Win Faster

BlueStacks

[Learn more](#)

Setup ha policy named 'ha-two' which all queue name start with 'two.' will be mirroring to the two nodes on the cluster.

```
sudo rabbitmqctl set_policy ha-two "^two\\.\" \
  '{"ha-mode":"exactly","ha-params":2,"ha-sync-mode":"automatic"}'
```

Setup a high availability policy named 'ha-nodes' which will contain all queues where the name starts with 'nodes.' We will be mirroring to two specific nodes 'hakase-ubuntu02' and 'hakase-ubuntu03' in the cluster.

```
sudo rabbitmqctl set_policy ha-nodes "^nodes\\.\" \
  '{"ha-mode":"nodes","ha-params":["rabbit@hakase-ubuntu02", "rabbit@hakase-ubuntu03"]}'
```

RabbitMQ list ha policies.

```
sudo rabbitmqctl list_policies;
```

RabbitMQ delete specific ha policy.

```
sudo rabbitmqctl clear_policy ha-two
```

```
root@hakase-ubuntu01:~# sudo rabbitmqctl set_policy ha-all "." {"ha-mode":"all"}
Setting policy 'ha-all' for pattern '.' to '{"ha-mode":"all"}' with priority '0'
root@hakase-ubuntu01:~# sudo rabbitmqctl set_policy ha-two "two\\.\" \
> '{"ha-mode":"exactly","ha-params":2,"ha-sync-mode":"automatic"}'
Setting policy 'ha-two' for pattern 'two\\.\" to '{"ha-mode":"exactly","ha-params":2,"ha-sync-mode":"automatic"}' with priority '0'
root@hakase-ubuntu01:~# sudo rabbitmqctl set_policy ha-nodes "nodes\\.\" \
> '{"ha-mode":"nodes","ha-params":["rabbit@hakase-ubuntu02", "rabbit@hakase-ubuntu03"]}'
Setting policy 'ha-nodes' for pattern 'nodes\\.\" to '{"ha-mode":"nodes","ha-params":["rabbit@hakase-ubuntu02", "rabbit@hakase-ubuntu03"]}' with priority '0'
root@hakase-ubuntu01:~# sudo rabbitmqctl list_policies;
Listing policies
 / ha-all all {"ha-mode":"all"} 0
 / ha-two all {"ha-mode":"exactly","ha-params":2,"ha-sync-mode":"automatic"} 0
 / ha-nodes all {"ha-mode":"nodes","ha-params":["rabbit@hakase-ubuntu02", "rabbit@hakase-ubuntu03"]} 0
root@hakase-ubuntu01:~# sudo rabbitmqctl clear_policy ha-two
Clearing policy 'ha-two'
root@hakase-ubuntu01:~# sudo rabbitmqctl list_policies;
Listing policies
 / ha-all all {"ha-mode":"all"} 0
 / ha-nodes all {"ha-mode":"nodes","ha-params":["rabbit@hakase-ubuntu02", "rabbit@hakase-ubuntu03"]} 0
root@hakase-ubuntu01:~#
```

Step 8 - Testing

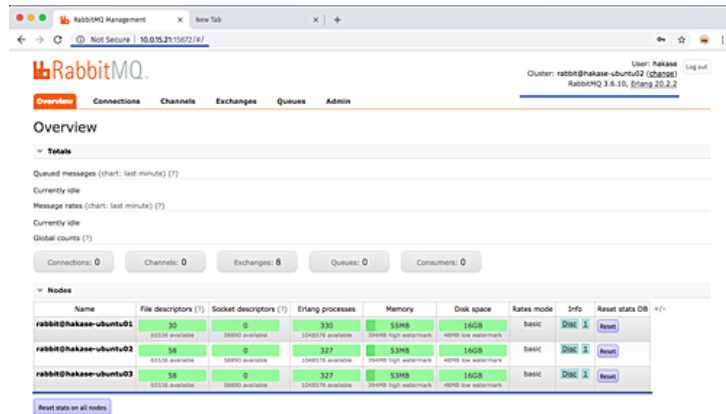

Open your web browser and type the IP address of the node with port '15672'.

<http://10.0.15.21:15672/>

Type the username 'hakase' with password 'aqwe123@'.

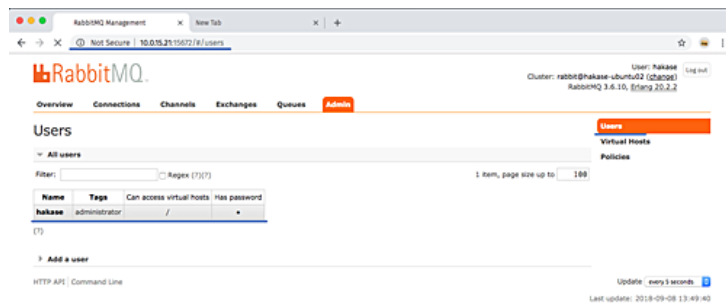

And you will get the RabbitMQ admin dashboard as shown below.

All cluster nodes status is up and running.

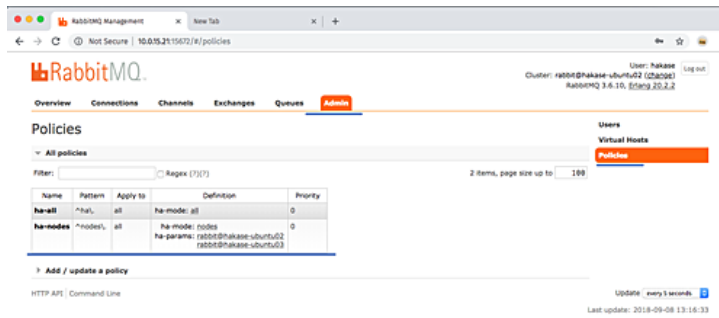

Now click on the 'Admin' tab menu, and click the 'Users' menu on the side.

And you will get hakase user on the list.

Now click on the 'Admin' tab menu, and click the 'Policies' menu on the side.

And you will get all RabbitMQ ha policies we've created.

The installation and configuration of RabbitMQ Cluster on Ubuntu 18.04 servers have been completed successfully.

Hi,

Is it possible to do this using Hyper-V and running all three VMs on the same machine?

Thanks

By: Muhammad **at:** 2018-10-11 21:30:37

Reply

Sure, it's possible to run the RabbitMQ cluster through vms.
